Wave Action

Helping manufacturers secure FCC certification for their manufactured devices that use part of the electromagnetic spectrum, especially devices that manufacturers may not know are regulated.

Problem

Companies are constantly developing and attempting to market new devices that emit radio frequency energy or use a portion of the electromagnetic spectrum. They may not be aware, before marketing these products, that all electronic devices require advance certification by the Federal Communications Commission to ensure that they are safe for use and that they do not interfere with existing uses of the spectrum by others.

Action

Take the necessary steps to have your device tested by an independent expert and submit the testing results to the FCC staff for regulatory approval. This applies to any product that uses a computer chip or emits radio frequency energy, even incidentally.

Results

After the FCC has certified the device, the manufacturer will be able to freely market it within the United States. A significant regulatory hurdle will have been overcome, and the sales and growth potential of the electronic device will be able to be realized. This applies to any manufacturer that is going to market with any device that uses a computer chip or part of the spectrum, not only to manufacturers of computer or radio/TV equipment.
